Weather Shakedown with Shook

Site Purpose:

Use the specifications listed in the Weather Site Project description to drive your content planning and sketches. Remember to reference the example and section descriptions given in the reading materials in this module to organize your document. You will be saving your final version as a .pdf document and linking to that document from your assignment portal page on your GitHub Pages site.

1. Create a folder name **lesson-4** within your **assignments** folder on your local site.
2. Use your favorite word processor or equivalent editor to build your site plan for the weather site. The site plan content requirements are given below.
3. Convert your completed site plan document into a pdf file type.
4. Save or move the completed site plan pdf document to the lesson-4 folder.
5. Update your index.html assignment portal page with a link to the site plan pdf document.
   ```
   Example: <a href="assignments/lesson-4/weathersiteplan.pdf">Weather Site
   Plan</a>
   ```

Site Plan Content Requirements

- an appropriate site name (not *The Weather Site*) and domain name,
- the site purpose,
- a description of the target audience including personas with at least five scenarios,
- a simple site map,
- a color scheme with references to elements/content, and
- typography selections with references to elements/content.

  You will not need to complete wireframe sketches. A town page wireframe sketch is provided to you from which to glean information about the content and layout of the page as you begin to build it in HTML.

Assessment

- Submit your completed planning document as a PDF file and as an attachment in the Website Planning Document assignment drop-box.
- Add a note to the drop-box with the URL of your course site,
  e.g., *http://githubusername.github.io*
- Upload that PDF file to a *lesson-4* directory inside the *assignment's* directory on your site, and create a link from your course home page.
